# **Real and Transcendental Functions**

#### **Real-Valued Functions**

Let *X* and *Y* be sets. A function *f* assigns to each xinX exactly one y = f(x)inY:

$$f: X \to Y, x \to f(x).$$

# **Domain and Range**

For  $f: X \to Y$ :

- **Domain**  $D(f) = \{x : f(x) \text{ is well-defined}\}.$
- Range  $R(f) = \{f(x) : x \in X\}.$

## **Parity**

- f is **even** if f(-x) = f(x) for all  $x \in D(f)$  (y-axis symmetry).
- g is **odd** if g(-x) = -g(x) for all  $x \in D(g)$  (180° rotation).

# Examples (domains & ranges)

| Function          | Domain  | Range                                       |
|-------------------|---|---|
| y = x             | $\mathbb{R}$  | $\mathbb{R}$                                |
| $y = x^2$         | $\mathbb{R}$  | $[0,\infty)$                                |
| $y = \sqrt{x}$    | $[0,\infty)$  | $[0,\infty)$                                |
| $y = \frac{1}{x}$ | $\mathbb{R}\setminus\{0\}$                                  | $\mathbb{R}\setminus\{0\}$                  |
| $e^x$             | $\mathbb{R}$  | $(0,\infty)$                                |
| $\ln(x)$          | $(0,\infty)$  | $\mathbb{R}$                                |
| $\sin(x)$         | $\mathbb{R}$  | [-1, 1]                                     |
| $\cos(x)$         | $\mathbb{R}$  | [-1, 1]                                     |
| $\tan(x)$         | $\mathbb{R}\setminus\{\frac{(2k+1)\pi}{2}:k\in\mathbb{Z}\}$ | $\mathbb{R}$                                |
| $\arcsin(x)$      | [-1, 1]   | $\left[-\frac{\pi}{2},\frac{\pi}{2}\right]$ |
| $\arccos(x)$      | [-1, 1]   | $[0,\pi]$                                   |
| $\arctan(x)$      | $\mathbb{R}$  | $\left(-\frac{\pi}{2},\frac{\pi}{2}\right)$ |
| y =  x            | $\mathbb{R}$  | $[0,\infty)$                                |

# **Function Operations**

# Composition

Given 
$$f: X \to Y$$
 and  $g: Y \to Z$   
 $(g \circ f): X \to Z, (g \circ f)(x) = g(f(x))$ 

#### Inverse

 $f: X \to Y$  is invertible if there exists  $f^{\{-1\}}: Y \to X$  with

$$f^{-1}(f(x)) = x$$
 for  $x \in X, f(f^{-1}(y)) = y$  for  $y \in Y$ .

## Piecewise (absolute value)

$$|x| = \begin{cases} x \text{ if } x \ge 0\\ -x \text{ if } x < 0 \end{cases}$$

## **Examples:**

1. Find the domain of this function:

$$f(x) = \frac{x}{x^2 - x} = \frac{x}{(x - 1)x}; x \neq 0, 1$$

 $Domain = \mathbb{R} \setminus \{0,1\} = (-\infty,0) \cup (0,1) \cup (1,\infty).$ 

- 2. The domain of  $\cos(x)$  is  $\mathbb{R}$  with range of [-1,1] Its inverse is  $\arccos(x)$  will have domain [-1,1] and range of  $[0,\pi]$
- 3. Parity questions:
  - 1) A find that is odd that is not a power of x: sin(x)
  - 2) A find that is even that is not a power of x: cos(x)
  - 3) A find that is neither even nor odd:  $sin(e^x)$  or  $e^x$
  - 4) A fin that is even and odd: f(x) = 0
- 4) Factor  $x^3 + 10x^3 + 13x 24$

Find a factor: x = 1, it will always be the factor of the constant term.

So 
$$x - 1$$
 is a factor of  $x^3 + 10x^3 + 13x - 24$ 

 $x^2 + 11x + 24$  is the quotient of the factorization of the polynomial.

$$x^{2} + 11x + 24 = (x+3)(x+8)$$

$$x^3 + 10x^3 + 13x - 24 = (x - 1)(x + 3)(x + 8)$$

**CHAPTER ENDS**
